DNA sequencing is the process of determining the order of nucleotides in DNA. It includes any method or technology that is used to determine the order of the four bases: adenine, guanine, cytosine, and thymine. The advent of rapid DNA sequencing methods has greatly accelerated biological and medical research and discovery.

In genetics, shotgun sequencing is a method used for sequencing long DNA strands. It is named by analogy with the rapidly expanding, quasi-random firing pattern of a shotgun. The chain termination method of DNA sequencing ("Sanger sequencing") can only be used for short DNA strands of 100 to 1000 base pairs. Due to this size limit, longer sequences are subdivided into smaller fragments that ...

An alternative to whole-genome sequencing is the targeted sequencing of part of a genome. Most often, this involves just sequencing the protein-coding regions of a genome, which reside within DNA segments called 'exons' and reflect the currently 'best understood' part of most genomes.

Detection of circulating tumor DNAs (ctDNAs) in cancer patients is an important component of cancer precision medicine ctDNAs. Compared to the traditional physical and biochemical methods, blood-based ctDNA detection offers a non-invasive and easily accessible way for cancer diagnosis, prognostic determination, and guidance for treatment.

Circulating Tumor DNA as Biomarkers for Cancer Detection

The Y chromosome (Y-DNA) is a DNA structure found in the nucleus of a male cell. Humans have 23 pairs of Chromosomes, 22 pair of autosomes and one pair of sex chromosomes, XX for females and XY for males. The Y chromosome is passed on without recombination by a father to his sons. SNP. A SNP (Single-nucleotide polymorphism) happens when a single place in the genome sequence is altered during ...
