In the 1920s and 1930s the so-called modern synthesis connected natural selection and population genetics, based on Mendelian inheritance, into a unified theory that applied generally to any branch of biology. The modern synthesis explained patterns observed across species in populations, through fossil transitions in palaeontology, and complex cellular mechanisms in developmental biology.

1. Introduction 1.1. Background. The concept of species conservation has been complemented by broader approaches to environmental challenges, such as the controversial "ecosystem services" concept (Costanza et al., 1997, Adams, 2014). However, in view of the increasing numbers of globally threatened species (), the protection and sustainable conservation of species demands more attention ...
